

Data model

Learn about the Endor Labs data model.

Objects are persistent entities within the Endor Labs system that represent the results of your scans. Specifically, they can describe:

- The projects and/or package versions that were scanned.
- The results of the scans, including **ScanResults**, **Findings**, and **Metrics**.
- The context used for the scan (for example, main branch vs. pull request).
- The policies used for the scans.

To create, modify, or delete objects, you need to use the Endor Labs REST API - Either indirectly with the `endorctl` command-line tool or directly with the REST API.
